pĭr'-ą-çў, ***pir-a-cie,** *s.* [Eng. *piro(te); -cy*; Fr. *piraterie*; Ital. & Sp. *pirateria.*]

1. *Lit. & Law:* The act, practice, or crime of robbing on the high seas. This offence at common law, consists in committing those acts of robbery and depredation upon the high seas, which, if committed upon land, would have amounted to felony there. But other offences have, by various statutes, been made piracy, and liable to the same penalty. Thus trading, or corresponding with, or in any way aiding, known pirates, is piracy. So, too, any commander or seaman of a ship who runs away with any ship, boat, goods, &c., or who voluntarily delivers such up to any pirate, is guilty of piracy. Furthermore, any one who conveys or removes any person as a slave is also by statute law guilty of piracy, felony, and robbery. The penalty formerly was death, whether the guilty party were a principal, or merely implicated as an accessory before or after the fact, but now the penalty is better proportioned to the crime.

¶ The art of pisciculture is of great antiquity, and is alluded to in Isa. xix. 10. Shaw, of Drumlanrig, revived the art in Britain in 1833, as Remy, a fisherman of Vosges, did in France in 1842. It is now practiced in many countries, greatly to the advantage of the food supply, which is capable of being enormously increased by the artificial propagation of fishes, care for the young until past the period of greatest danger, and stringent regulations in regard to methods of fishing. Pisciculture is practiced in the United States on a larger scale than in any other country, the fish thus artificially produced being principally the salmon, the shad, and the white fish, though trout, pike, carp, and other fishes are similarly cared for. The White-fish (*Coregonus clupeiformis*) is grown in enormous multitudes in the lake hatcheries, over 250,000,000 eggs having been hatched in a single year. Young shad are raised to the number of many millions annually, and the same may be said of the salmon, many new streams having been stocked with these fish.

Mech.: A device so fitted as to occupy the sectional area of a tube and be capable of reciprocation by pressure on either of its sides. It may be of any shape corresponding accurately to the bore of the tube; but the cylindrical form is almost exclusively employed for both, as in the common pump and the steam-engine. One of its sides is fitted to a rod, to which it either imparts reciprocatory motion, as in the steam-engine, or by which it is itself reciprocated, as in the pump. In the former case, it has no opening leading from one side to the other, and is termed solid, though generally not really so; but in the latter, an aperture controlled by a valve permits the passage of the fluid from one side to the other during its downward movement. A distinction is, however, made in pumps; the solid piston being known as a plunger, the hollow piston as a bucket. The piston usually requires packing to cause it to fit closely within its cylinder, and at the same time allow its free backward and forward movement.

II. *Pathol.:* A peculiarly malignant fever of the continued and contagious type, now believed to be almost identical with the worst kinds of typhus fever. It is produced by the absorption of a poison generated by decaying animal matter combined with heat, moisture, and bad ventilation. The famines produced by the ravages of locusts, and the subsequent decay of their bodies, often generate it. The period of incubation varies from a few hours to three weeks. It chiefly attacks the cervical, axillary, inguinal, and mesenteric glands, producing buboes, carbuncles, &c. The "boil" from which Hezekiah suffered seems to have been the carbuncle of plague (2 Kings xx. 7, Isaiah xxxviii. 21). At first there is great restlessness, followed ultimately by corresponding exhaustion, and death supervenes in two or three days. Grand Cairo is the chief known focus of the plague, the spread of which, in different directions, is at least attempted to be checked by quarantine. The plague seems to have been the Black Death of the fourteenth century. It was known by the name of plague when, in 1665, it slew in London 68,596 people, about one third of the population. The great fire of London (1666) obtains the credit of having banished the plague from the metropolis by destroying the fever nests which it had infested.

Astron.: A heavenly body which, to old-world observers, seemed to wander about aimlessly in the sky, thus markedly contrasting with the orderly movements of the fixed stars. Subsequeutly it was discovered that the seemingly erratic bodies were as regular in their movements as the others, revolving, like the earth, around the sun, the aberrations arising from the fact that both the planets and the observers were in motion. When they are comparatively near the earth and move thence to go round the sun, they seem to go in one direction; when they return on the other side of their orbit, they appear to retrograde in the sky. Shining only with reflected light, they shine with a steady radiance in place of twinkling like the fixed stars. Planets are primary or secondary, the former revolviug aroiud the sun, the latter around the primaries. The primary planets known to the ancients were five, Mercury, Venus, Mars, Jupiter, and Saturn. Omitting asteroids, comets, and meteoric rings, eight are now known, Mercury, Venus, the Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Twenty secondary planets are known, the Moon, two satellites of Mars, four of Jupiter, eight of Saturn, four of Uranus, and one of Neptune. The existence of an intermercurial primary planet has been suspected but not proved. The planets Mercury and Venus, being nearer than the Earth to the Sun, are called inferior planets; the others, being more distant, are termed superior. Another classification is somctimes adopted, that into intra- and extra-asteroidal planets, that is, those nearer and those more remote from the sun than the asteroids. Under the first are included, Mercury, Venus, the Earth, and Mars, all of which are comparatively small, while the others, Jupiter, Saturn, Uranus, and Neptune are the giants of the system. For instance, the Earth is 7,918 miles in diameter, and Mars 4,200, but Jupiter is 85,000. The intra-asteroidal planets complete the annual revolution in short periods, the Earth, for example, in 365·26 days, while Neptune takes to do so 60,127 days, or about 165 years. The minor planets, planetoids, or Asteroids are between Mars and Jupiter. The Asteroids have already beeu described under that head. Of the major planets it may be stated that the Earth was not anciently regarded as a planet, but as the centre of the uuiverse, around which not ouly the other planets, but the sun aud the fixed stars, revolved. Modern research has relegated it to its proper place, as a comparatively insignificant member of the family of planets, and a pigmy in dimensions as compared with the fixed stars, whose representative we have in the sun. Of the two planets of modern discovery, Uranus was discovered by Sir William Herschel iu 1781; and Neptune, whose existence was suspected and place determined from the perturbations which it caused in the motious of Uranus, was discovered by Professor Challis and Dr. Galle in 1846. Uranus and Neptune are invisible to the naked eye. The visibility of the others is due to reflected solar light, though it is uot quite sure that the larger planets, such as Jupiter, may not have some light-yielding powers of their own. The distance of the planets from the sun—the centre ot the solar system—differs enormously. While Mercury is about 35,400,000 miles distant, and the Earth something over 92,000,000 miles, Uranus is 1,753,869,000, and Neptune 2,745,998,000 miles distant. Their speed of motion in their orbits differs correspoudingly, Mercury darting around the sun at a speed nine times as great as the deliberate sweep of the far-distaut Neptune. This difference of speed is in strict accordance with the theory of gravitation, the planets nearer the sun being exposed to the greater solar attraction, and ueeding a correspondingly greater rapidity of motion to overcome the energy of this attraction and maintain their orbital distances. The orbits of the planets are not circles, but ellipses, the degree of departure from the circle varyiug. Venus most nearly approaches the circle in its orbit, Mercury and some of the planetoids being the most eccentric. The plaue of diurual rotation does not coincide with the plane of the orbit, a fact which gives rise to the aunual variety of seasons. This eccentricity also varies greatly, the inclinatiou of the equatorial plane of Venus being appareutly the greatest, while that of Jupiter is very small. As regards the density of the planets, that of the small is much greater than the large, Saturn, for instance, beiug ouly about oue-eighth as dense as the earth.

¶ In this sense Mr. A. S. Palmer considers the word to be the O. Fr. *plant* = a plan.

II. *Technically:*

1. *Nat. Science:* Linnæus defined a plant as an organised body (being) possessed of life, but not of feeling. In his contrasted definition of an animal, he assigned the latter life, feeling, and voluntary motion, implying that if a plant moved it did not do so voluntarily. His definition is essentially accurate. With regard to all the higher members of the Vegetable and Animal Kingdoms, there is no difficulty in saying which is a plant and which is an animal. Some Mimosas, &c., have a certain sensitiveness when touched, but notwithstanding this they are clearly plants. But "Natura non facit saltus" (Nature does not make leaps, that is, abrupt transitions); and the humbler members of the two kingdoms are so closely akin, that whether sponges were animal or vegetable was once a debatable question, though now they are considered compound animals, while again many of Ehrenberg's Infusoria, once ranked as animals, now figure as humble Algals. Plants derive their nourishment directly from the mineral kingdom, animals do so only through the intervention of plants. The latter are, as a rule, composed chiefly of carbon, hydrogen, and oxygen; animals have nitrogen as well. Plants generally absorb carbon dioxide, and give

forth oxygen; animals reverse the process. With slight exceptions cellulose and chlorophyll are distinctively vegetable productions. A plant consists of a root, of organs of vegetation, and organs of reproduction. It may be annual, biennial, or perennial (q.v.). It may be a herb, an undershrub, a shrub, or a tree. It may be evergreen, or have deciduous leaves. In winter there is a suspension of assimilative power and growth, like the hybernatiou of animals. The close of petals and the folding of leaves at night in some plants suggest their sleep. Like animals sooner or later they die. De Candolle conjectured that the known plants were from 110,000 to 120,000.

Much uncertainty exists as to the place in the system of many species of fossil plants, and scientific names frequently indicate that doubt. Though there is much doubt as to fruit, there is more as to leaves, for they often have the same form and venation in orders remotely apart from each other. Hence at present the vegetable unit is much less valuable than the animal in investigating fossils. The first appearance of plants seems to have been in the Silurian rocks; they were probably Algæ. In the Upper Silurian Acrogens and Conifers first appear. The Acrogens greatly predominated during the Carboniferous period; the Cycads attained their maximum during the Jurassic and Lower Cretaceous. Dicotyledons began apparently before the close of the Cretaceous, and became dominant in the Tertiary.

Photog.: A printing process by which permanent pictures in platinum black are produced. When exposed to light under the negative, the ferric oxalate becomes converted into ferrous oxalate in exact proportion to the amount of light it has received. The picture is developed by floating the exposed paper upon a solution of potassic oxalate, 130 grains to the ounce, at a temperature of from 170–180°. The ferrous salt formed by the action of the light reduces the platinum to a metallic state in the presence of the potassic oxalate solution, thus forming the image. A wash in dilute hydrochloric acid, 1 in 80, completes the process.

plăt'-ĭn-oŭs, *a.* [Eng. *platin(um); -ous.*] Containing or consisting of platinum; of the nature of platinum.

plăt'-ĭn-ŭm, *s.* [PLATINA.]

Chem.: Symbol, Pt. Atomic weight, 197·4; sp. gr. = 21·6. A tetrad metallic element discovered first in America, and still largely obtained from that country; also found in the Ural chain, and in copper ore from the Alps. [PLATINUM-ORE.] The ore is treated with nitromuriatic acid, which dissolves platinum and palladium, the solution is then treated with potassic chloride, yielding the double salt of platinum and potassium—the palladium being left in solution. By igniting with carbonate of potash, the platinum is reduced to the metallic state. It still contains traces of iridium, which gives it greater hardness and tenacity. Pure-forged platinum takes a high lustre, is nearly as white as silver, and very ductile and malleable. It resists the strongest heat of the forge-fire, but can be fused by the electric current; is the heaviest known substance excepting osmium and iridium, is unalterable in the air, dissolves slowly in nitromuriatic acid, but is not attacked by any single acid. Its properties render it extremely useful to the chemist for the construction of crucibles, evaporating dishes, and stills used in the concentration of oil of vitriol.

platinum-antimonide, *s.*

Chem.: An alloy formed by acting on spongy platinum with two parts of pulverised antimony. It unites with vivid incandescence, and when further heated fuses into a steel-gray fine-grained alloy.

platinum are capable of taking up ammonia and forming amines, *e.g.*, diammonio-platinous, chloride = $(H_3N)_2Pt''Cl_2$, is obtained by neutralising a solution of platinous chloride in hydrochloric acid with carbonate of ammonia, heating to the boiling point, adding to it ammonia, and allowing to cool. It deposits as a yellow crystalline salt. Methylamine combines with platinous chloride in a similar way, forming the compound, $PtCl_2(CH_5N)_4$ $PtCl_2$, a chrome-green powder.

platinum-black, *s.*

Chem.: Platinum in a finely-divided state. Obtained when alcohol is carefully added to a solution of platinous chloride in hot concentrated potash. When purified and dried it resembles lamp-black, condenses gas in its pores like charcoal, and converts alcohol into acetic acid.

platinum-boride, *s.*

Chem.: Pt″B. Obtained as a silver-white fusible compound, when boron is heated with platinum foil before the blowpipe.

platinum-carbide, *s.*

Chem.: PtC (?). A compound obtained by calcining organic platinum salts at a moderate heat. Is slowly attacked by nitromuriatic acid.

platinum-chlorides, *s. pl.*

Chem.: Platinum forms two chlorides: (1) Platinous chloride, $PtCl_2$. Prepared by heating platinic chloride, by the aid of an oil bath, to 200°, until it becomes insoluble in water. It is a greenish-brown solid body, soluble in hydrochloric acid as dichloride, if protected from the air. It dissolves in caustic potash, and all the platinum is thrown down as platinum-black on the addition of alcohol. With metallic chlorides it forms double salts, most of which are highly crystalline. (2) Platinic chloride, $PtCl_4$. Obtained by dissolving platinum in nitromuriatic acid and evaporating over the water-bath. It forms a brown-red mass, easily soluble in water, and combines with potassium chloride to form one of the most important double salts of platinum, K_2PtCl_6, insoluble in alcohol.

platinum-iodides, *s. pl.*

Chem.: Platinum forms two iodides: (1) Platinous iodide, PtI_2, and (2) Platinic iodide, PtI_4. They are obtained as black amorphous compounds on treating the corresponding chlorides with iodide of potassium.

platinum-oxides, *s. pl.*

Chem.: Platinum forms two oxides. (1) Platinous oxide, Pt″O, obtained as a hydrate, $Pt''OH_2O$, by digesting platinous chloride in warm potash. At a gentle heat it becomes anhydrous, and dissolves slowly in acids, forming unstable salts. (2) Platinic oxide, $Pt''O_2$, obtained with difficulty by decomposing a solution of platinic sulphate with carbonate of calcium, and dissolving out the calcium sulphate and carbonate with weak acetic acid. It is a black powder, which dissolves in acids, forming uncrystallizable salts.

Plā'-tŏn-ĭşm, *s.* [Fr. *plutonisme.*]

Hist. & Philos.: The philosophy of Plato, or rather that attributed to Plato, for though his writings exerted a marvellous influence over the minds of his successors, and, in a certain degree, over the early Christian Church, yet in those writings there is nothing like a connected system to be found. G. H. Lewes (*Hist. of Philos.* (ed. 1880), i. 220) says: "I come to the conclusion that he never systematized his thoughts, but allowed free play to scepticism, taking opposite sides in every debate, because he had no steady conviction to guide him; unsaying to-day what he had said yesterday, satisfied to show the weakness of an opponent." Nevertheless, he is of opinion that certain theoretical views, which frequently recur in the writings of Plato, in more or less modified form, may be loosely styled Platonic theories, though "they are sometimes disregarded, at others contradicted." These are (1) The theory of Ideas [IDEA]; (2) The doctrine of the Pre-existence and Immortality of the Soul; and (3) The subjection of the popular divinities to one Supreme God.

plī'-ō-çēne, pleī'-ō-çēne, *a.* [Gr. πλειών (*pleiōn*) = more, and καινός (*kainos*) = recent.]

Geol.: The epithet applied by Sir Charles Lyell to the most modern of the three periods into which he divided the Tertiary. Its distinguishing character is that the larger part of the fossil shells are of recent species. Lyell divides it into the Older and the Newer Pliocene. In the Older, the extinct species of shells form a large minority of the whole; in the Newer, the shells are almost all of living species. Deshayes and Lyell considered that the Older Pliocene had 35 per cent. and the Newer 90 to 95 per cent. of the shells of recent species. Etheridge makes the number 40 to 60 per cent. for the Older and 80 for the Newer Pliocene. Lyell's divisions (in reverse order) of the Pliocene are these:

OLDER PLIOCENE.—*British:* Red Crag of Suffolk; White, or Coralline Crag of Suffolk. *Foreign:* Diestien and Antwerp Crag; Sub-Apennine Marls and Sands, and Pliocene of North America. Deposit at Pikermi, near Athens; strata at the Sivalik Hills.

NEWER PLIOCENE.—*British:* Forest-bed of Norfolk Cliffs; Norwich Crag. *Foreign:* Eastern base of Mt. Etna; Sicilian strata; Lacustrine strata of Upper Val d'Arno: German and French Pliocene.

Etheridge places also under the Older Pliocene the Aralo-Caspian brackish-water formations, and under the Newer the Chillesford and Bridlington beds. There is a rich Pliocene flora in Italy. Mr. Gaudin and the Marquis Strozzi enumerate pine, oak, evergreen oak, plum,

plane, elder, fig, laurel, maple, walnut, birch, buckthorn, &c. The Pliocene strata of the United States contain numerous fossils of an interesting character, most of them the immediate predecessors of the existing animals of America and Eurasia. At Pikermi, in Greece, a remarkable group of Pliocene fossils has been exhumed, and the same is the case at the Siwalik Hills, in India. The Newer Pliocene was contemporaneous with part of the Glacial Period (q.v.).

Their communities are of what is known as the Evangelical Calvinistic type, and many of them maintain that only among themselves is true Christianity to be found. They have no regular ministry, every brother being at liberty to prophesy or preach whenever moved to do so. They baptize all adults, whether previously baptized or not, and observe the Sacrament of the Lord's Supper weekly. They are rigid Predestinarians and expect the Millenium. Blunt (*Dict. Sects*, p. 433) says that they are a growing sect, but have little organic unity, being broken up into sections owing to disputes, arising from the liberty conceded to each member to preach or prophesy at will.

It appears as hypostatic pneumonia, and in some malarial districts it occasionally becomes epidemic. It commences with hyperæmia and œdema,

followed by fibrinous exudations in the interior of the air cells and capillary bronchi, undergoing many changes of the most serious character, such as abscess, purulent infiltration, gangrene, &c. The right lower lobe is the most frequent point of attack, bronchitis and pleuritic exudation are common accompaniments. Herpes is frequently observed on the face and lips on the third or fourth day; prostration, dry brown tongue, cracked lips, with viscid expectoration of a rusty-nail colour, and in the acute hepatization stage, red blood-tinged sputum, are the usual symptoms, with fine crepitation, like the rustling of a hair rubbed between the fingers. II. *Technically*:

1. *Pharm.*: Professor Christison divides poisons into three great classes: irritants, narcotics, and narcotico-acrids or narcotico-irritants. A fourth class is sometimes added, septics, consisting of animal poisons, such as the bites of rabid animals and venomous snakes, the stings of insects, and the poison generated by pestilential carbuncle, &c. An irritant poison produces violent pain and cramp in the stomach, nausea, vomiting, convulsions &c. A narcotic poison produces stupor, numbness, drowsiness, coldness, and stiffness of the extremities, cold fetid greasy perspiration, vertigo, weakened eyesight, delirium, paralysis of the lower extremities, &c.; a narcotico-acrid poison produces a certain combination of the symptoms attendant on both the former classes. The chief irritants are the acids and their bases, some alkalis and their salts, the metallic compounds, as arsenic, mercury; the vegetable acrids or irritants, as some Cucurbitaceæ, Euphorbiaceæ, Ranunculaceæ, &c.; animal irritants, as cantharides; mechanical irritants, as glass, &c; irritant gases, as chlorine, the vapour of nitrous acid, &c.; narcotic poisons, as opium, nightshade, prussic acid, &c.; narcotico-acrids, such as strychnine, *Cocculus indicus*, and poisonous mushrooms. Savages poison their arrows by the milky juice of various Euphorbias or of the manchineel, or by the juice of two species of Strychnos. Both in man and in the inferior animals there is often a curious correlation between the colour of the skin and hair and immunity from the action of certain vegetable poisons. Metallic poisons act upon vegetables nearly as they do upon animals, that is, they are absorbed into the different parts of a plant, destroying the structure. Vegetable poisons, especially those which destroy animals by action upon their nervous system, also cause the death of plants.

2. *Law*: By the present laws of most of the states, only qualified persons are allowed to sell poisons. In all cases the word "poison" and the name and address of the vendor must be upon the label. No poisoned seed, grains, or flesh must be exposed on land.

It is quite white when young, changing to a creamy tint in maturity. Unlike most of its congeners, it is carnivorous, attacks by biting, not by hugging, and only the pregnant females hibernate. Many tales are told of its ferocity, which appear to have been exaggerated by early travellers, and the probability is that, unless interfered with or pressed by hunger, it rarely attacks man.

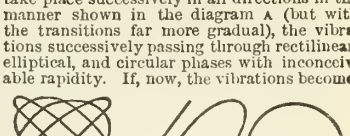
¶ (1) *Polarization of light:*

Optics: A state into which the ethereal undulations which cause the sensation of light are brought under certain conditions. These undulations are perpendicular to the line of transmission of the wave, as in a stretched cord, but, in a ray of common light, appear to take place successively in all directions in the manner shown in the diagram A (but with the transitions far more gradual), the vibrations successively passing through rectilinear, elliptical, and circular phases with inconceivable rapidity. If, now, the vibrations become,



or are rendered, stable in any one form of orbit, the light is in the condition known as polarised, and the state is one of plane, elliptical, or circular polarization, according as the orbit resembles B, C, or D. The most familiar and simple form is that of plane polarization. This may be produced in various ways, the piece of apparatus producing such modifications being called a Polarizer. When produced, however, the effects can only be perceived by examining them through another piece of apparatus which, used alone, would polarize the light, but when used to examine light already polarized, is called the Analyser. The two in combination, with the necessary adjustments, form a Polariscope, of which there are many forms.

(*a*) *Plane polarization:* When a ray of common light passes through a crystal (not of the cubic system), the atoms being so arranged that the elasticity (or other properties affecting motions of the ether within the crystal) are different in different directions, the ether motions are at once resolved into that of the greatest and the least elasticity at right angles to the path of the ray, so dividing the ray of common light into two "plane polarized" rays, polarized in planes at right angles to each other. One of these rays being easily eliminated by total reflection in the Nicol prism (q.v.), two such prisms form a convenient polariscope. The ray, after passing through the first prism, appears just like common light, only of half the original brilliancy; but on looking at it through the second Nicol, on turning the latter round, we find two positions in which the light from the first Nicol gets through the second unaltered; and two positions at right angles to the former in which it is absolutely stopped, and the second prism, though clear as glass, is absolutely opaque to it. The beam of light appears thus to have acquired sides, and to behave differently according to the relation these sides bear to the position of the prism. Such is the fundamental nature and phenomenon of Polarized Light. Light is also polarized by reflection from polished transparent surfaces, when incident at such an angle that the reflected and refracted rays make a right angle. In glass, this angle is about 56°. An exactly equal quantity of the incident light which is transmitted through the glass, is polarized in a plane at right angles to the former. At other angles the effect is partial. The scattered light of the sky is always more or less polarized, as is all light reflected from small particles in air or water, if the particles are small enough: the polarizing angle for such particles is, as might be expected, 45°.

(*b*) *Chromatic polarization:* Let the perpendicular vibrations from a Nicol prism encounter in their path a crystalline film of selenite or mica, whose planes of greatest and least elasticity are arranged diagonally. The perpendicular vibrations are again "resolved" into two sets, one of which is retarded behind the other owing to the difference in the two elasticities. The analyser "resolves" each of these again, bringing half of each set back into one plane. The two sets of waves are then in a position to exercise interference, and the consequence is that, if the plate or film is of suitable thickness, the most gorgeous colours are presented. It is the same with every substance having different elasticities in different directions, and as all "structure" presents such differences, polarized light becomes the most powerful weapon of the biologist, revealing structure where ordinary light will not do so.

(*c*) *Circular polarization:* If two rectangular, equal impulses are given to a pendulum, or to a stretched cord, one of them a quarter-vibration later than the other, the two are compounded into a single circular orbit. Therefore, if a beam of plane-polarized light

passes, as in the last paragraph, through a film of mica of such a thickness that one of the two diagonally vibrating sets of waves shall be retarded, whilst in the film one quarter-vibration behind the other, the two are compounded on emergence into one beam of circularly-polarized light. At approximate thicknesses, the light is elliptically polarized. Circularly polarized light is never stopped by the analyser, but differs from common light in producing polarized effects. The most important of these is

(*d*) *Rotatory polarization:* Vary the former experiment by passing the light from the polarizing Nicol, with its vibrations in a vertical plane, through a plate of selenite or mica which gives fine colour; the vibrations are then in the two diagonals. Let this light now traverse a "quarter-wave" mica film, with its polarizing planes perpendicular and horizontal. Each set of rays from the first plate becomes circularly polarized, but the two in opposite directions, the circular movements thus opposing each other. Whenever two circular motions thus meet, as in two circular pendulums clashing, the tangential motion is destroyed, and the pendulums would both fall back together through the centre of the former orbit. It is so in this case; but as one set of rays has been retarded in the plates more than the other, the swing of the ether atoms is no longer in the original plane of vibration. Let that plane be A, B; instead of the two circular waves meeting at A again, as they would if both circular motions were equally rapid, the meeting-point will be somewhere on one side or other of it, as at M. There the right-handed ray will meet the left-handed ray, the tangential motions RM, LM, will be destroyed, and the radial forces unite in the plane-polarized swing-orbit M P, passing through the centre C. If, therefore, light of one wave-length or colour be employed, instead of the analyser having to be turned across A B to extinguish it, it must now be turned across M P—in other words, the original plane of polarization has been rotated. If white light be employed, the many various wave-lengths will obviously meet at different points, and hence rotation of the analyser will give in succession more or less of the colours of the spectrum. If the quarter-wave film is cut in half, and its position reversed in one half, the transition of colours will occur in opposite orders in the two halves. Rotatory polarization is of the greatest practical importance. There are many crystals, plates of which, when cut in proper directions, produce naturally all the phenomena of the double-plate described above. Many fluids, such as oil of lemons, turpentine, and solution of cane sugar, also show the same phenomena very strongly, and in their case it is remarkably connected with the presence in the molecule of what chemists call "asymmetrical atoms." In solutions, as of sugar, the amount of rotation is proportionate to the quantity of sugar in solution in a given column of fluid; hence the "estimation" of crystallizable sugar, whenever accuracy is required, is now always made by the polariscope. Faraday discovered, in 1845, that the property of rotatory polarization was conferred upon any transparent body when the axis of the ray employed was made the axis of a galvanic solenoid or strong magnetic field. polarized-rings, *s. pl.*

Optics: Imagine a crystal symmetrical around a single axis, like a section of the trunk of a tree, with the elasticity greatest or least in the direction of the axis, and symmetrically alike all round the circumference. If we cut a plate in the way of a plank, it will behave like the films already spoken of. But if a slice he cut across the trunk at right angles it must be different, when a ray of light passes through in the direction of the axis. The ether vibrations are at right angles to the path of the ray (now the same as the axis), but in all these directions the elasticity is equal, consequently a beam of common light will not be doubly-refracted, nor a beam of plane-polarized light further resolved, in passing along the axis. This is borne out by cutting a plate of calcite at right angles to its axis. But if the ray passes through such a plate obliquely, double refractions and interference will come into action, and we shall perceive colour. Imagine now a conical, or strongly convergent pencil of plane-polarized light traversing the plate, and the analyser turned so as to extinguish the light passing the polarising Nicol. The centre of the plate, where the beam is truly axial, will still appear dark. But, as the light becomes more and more oblique, the vibrations will be resolved into some plane passing through the axis, and planes at right angles to these, or tangential planes. In perpendicular and horizontal planes, these will cause no further resolution of the vibrations, and there will therefore be a black cross when the analyser is crossed; but in all other planes, the more and more oblique light must cause successive rings of light and darkness, or, when white light is employed, of colour, as shown in fig. A. In crystals which are not perfectly symmetrical about one axis, the ideal structure may be compared to that of a tree-trunk of an oval section. Here, a plank would still give two polarizing planes, as in a film of selenite; but a transverse section would also show two rectangular elasticities. In such a case, analysis proves that there must be two lines or axes inclined to each other, in which there can be no double refraction, and that the fringes of colour must take the general shape of lemniscates, as shown in fig. B. In many crystals the properties are quite different for light of different wave-lengths, and in some, the plane of the axes is at right angles for one end of the spectrum to what it is for the other. The relation of the elasticities may also be profoundly changed by heating the crystal, so that the intermediate one becomes greatest or least; in such cases, as in heating selenite, the double rings of B gradually merge into one as at A, and then the two rings spread out again in a direction at right angles to the former. Generally, it may be said that cubic crystals possess no double refraction; that crystals symmetrical round one axis are uniaxial, doubly-refracting, and exhibit circular rings; and that other crystals are bi-axial, and exhibit double rings. All these phenomena are of the greatest importance in the study of rocks, and the fragments of crystals embedded in them.

Sometimes there are intermediate poles, called "consequent poles." When the earth is viewed as a magnet, the spots where the magnetic needle stands vertical are called the "magnetic poles." In 1830 Sir James Ross found that the magnetic north pole was in 76° N. and 96° 43′ W. At the same time the position of the magnetic south pole was calculated to be in 75½° S. and 154° E. But it does not always retain the same place. This is shown by what is called the declination or variation of the magnetic needle, *i.e.*, the angle which it makes with the geographical meridian. At London, in 1580, this was 11° 36′ E., and in 1884, 18° 8′ W.

[Precession.] Even now the circle it describes is too small to be discernible by the ordinary eye. The pole-star is really a double star of yellow hue, but while the larger or visible one is between the second and third magnitude, its companion is only of the ninth, and therefore a telescopic star. 1. *Comm.:* A document containing a promise to pay a certain sum of money on the occurrence of some event. In return for this promise a sum of money is paid down, called the premium (q.v.). By far the largest part of insurance business is applied to disasters at sea; to destruction of property by fire; to making provision for heirs and successors in case of death, and to loss of time and expense through accident. The practice of insurance has also been extended to making provision against loss of crops from bad weather, against destruction of glass from storms and accidents, &c. In every case a form is filled up containing a promise to pay a certain sum in the event of the happening of the specified contingency, and this document is always called the policy. Although an insurance policy is a contract, it is only signed by one party, the insurer, who for that reason is called the underwriter, and forms, therefore, what is called in law an unilateral contract. Marine policies are of two kinds: (1) Valued policy, one in which the goods or property insured are at a specified value; (2) Open policy, one in which the value of the goods or property is not mentioned. political-economy, *s.* According to John Stuart Mill, the science which investigates "the nature of wealth and the laws of its production and distribution, including, directly or remotely, the operation of all the causes by which the condition of mankind, or of any society of human beings, in respect to this universal object of human desire, is made prosperous or the reverse." (*Polit. Econ., Prel. Remarks.*) Inquiries on these points must have existed from the earliest times in every nation, but political economy as a science

is very modern. Crude views on the subject arose in the middle ages in the free Italian cities and the Hanseatic towns, where apparently originated some of the fallacies still current among sections of the British population. Sir Walter Raleigh (1595), Sir William Petty (1667), and Sir Dudley North (1691) wrote on the subject with enlightenment for their age. François Quesnay, in France (1768), founded the school of the economists which held that the soil is the source of all wealth. [Physiocrat.] Adam Smith (1723–1790) had made political economy a portion of his lectures whilst Professor in Glasgow University from 1751 to 1764. Visiting Paris in that year, he became acquainted with Quesnay and the leading economists, but the principles of his great work, the *Wealth of Nations*, published after ten years' retirement, in 1776, were, in the main, thought out independently. It was immediately and extensively popular, and is still much admired. Since Adam Smith's time, no work on the subject has appeared more original or influential than the *Principles of Political Economy*, by John Stuart Mill. In this and his other productions advocating liberty, he yet considers that public opinion and, if need be, even law should be directed against the increase of population when there is no hope of comfortable, or at least of decent, maintenance, and that the unearned iucrement of land should be appropriated by the state. Several valuable works have been written by American authorities on this subject, and the tendency of thought now is to discard some of the old axioms of political economy, and to re-establish the subject on a basis more in accordance with fact than with theory.

(See extract.)

"Plurality of wives has everywhere tended to become a more or less definite class distinction . . . Joining which facts with those furnished to us by the Hebrews, whose judges and kings—Gideon, David, and Solomon—had their greatness so shown; and with those furnished us by extant Eastern peoples, whose potentates, primary and secondary, are thus distinguished; we may see that the establishment and maintenance of *polygyny* has been largely due to the honour accorded to it, originally as a mark of strength and bravery, and afterwards as a mark of social status."—*H. pŏl'-ĭ-thē-ĭsm, *s.* [Pref. *poly-*; Gr. θεός (*theos*) = God, and suff. *-ism*; Fr. *polythéisme.*]

Compar. Relig.: The worship of many gods. It is not necessarily the same as idolatry, for gods may be adored without any image of them being made. In Sir John Lubbock's classification of religious beliefs, Fetishism and Totemism are polytheistic; the next stage in the ascending order, Anthropomorphism, may or may not be so. No mention is made in Scripture of Polytheism before the flood. It existed among the ancestors of Abraham in Ur of the Chaldees (Joshua xxiv. 2). The first commandment is levelled against it (Exod. xx. 3, Deut. v. 7). It was common at the time among the Canaanites (Deut. vi. 14, vii. 4, &c.). At many periods the Jews, high and low, lapsed into it (1 Kings xix. 2; 2 Kings xvii. 16, 17; Ezek. viii. 3–18). Though some of the Greek and Roman philosophers may have risen above polytheism to conceive the unity of God, the masses of the people were polytheistic, as is the case with the ethnic nations to-day, though in some cases, as in that of India, pantheism underlies polytheism, and some apparent polytheists really believe all nature to be one God.

1. *Zool.:* The name given by J. W. Thompson in 1830 to what Ehrenberg called Bryozoa. In 1841 H. Milne-Edwards united the Polyzoa, Brachiopoda, and Tunicata (q.v.) in his group Molluscoida. It has been since shown that the latter belong to the Vertebrata, and the relation of the first two rested on a mistaken identification of parts. The Polyzoa appear to be closely related to the Sipunculoid Gephyræan Worms, and are thus classified and characterized by Prof. E. Ray Lankester (*Ency. Brit.* (ed. 9th), xix. 430):

Sect. 1. Vermiformia.

In 1436 St. Colette brought back a number of houses in France and Flanders to the observance of the rule of St. Francis. The Poor Clares have given their name to a district of London—the Minories—the site of the first house of the order founded in England (1263). They have now (1886) five houses in this country, and six in Ireland.

poor-law, *s.* The body of laws enacted by parliament from time to time for the management of the funds collected for the maintenance of the poor.

¶ The Act 23 Edward III., passed in 1349, enacted that no person should give alms to a beggar able to work. The support of the poor was undertaken by the church. By 27 Henry VIII., passed in 1535, and necessitated by the dissolution of the monasteries, a compulsory poor law was established. The 43 Elizabeth c. 2, passed in 1601, contained the germ of the present poor law. It directed parishes to relieve the blind, the lame, and the impotent, and appointed overseers of the poor. It was modified in 1662. In 1722 the workhouse system began. The pauperism of England in the early part of the present century became so severe a burden, that restrictive laws became necessary, and the whole system was reorganized in 1834. The new law did away with the practice of out-door relief, and required paupers to reside in the work-houses and to submit to a labor test. The result was that, while before 1834 one person in every twelve was a pauper, in 1867 the percentage of paupers had fallen to one in twenty-five.

In the United States the system of poor-relief is somewhat similar to that of Great Britain. The states have their own poor-laws, but paupers are removable from one state to another, and must be able to claim a fixed period of residence to become a charge on the town or township. There are State Boards of Charity, which have general control of the system of poor-relief. The pauper loses his rights as a citizen. The American system generally is marked by high degree of classification, special educational methods, and liberal diet. Within recent years a new system of preventing pauperism has been devised in Germany, and is now in operation. This is what is known as compulsory insurance, compulsory contributions being collected from workmen and employers, and added to by the state, as an insurance against permanent disability and old age.

5. The Bullfinch (q.v.).

¶ The term Papa, or Papas (father), has always been given by the Greek Church to presbyters, like the term Father now applied to a Roman priest. In the early centuries the bishops received the same title till, in a council held at Rome in 1076, at the instance of Gregory VII. (Hildebrand), it was limited to the Bishop of Rome. Holding that office, being also Metropolitan of Rome and primate, and claiming to be the earthly head of the Church universal, it is in the last-named capacity that the term Pope is held to be specially applicable. [CONCLAVE.] It has been a matter of controversy among Roman Catholics whether the authority of the Pope was above or below that of the General Council. That of Pisa (1409), claiming to be a General Council, deposed two rival popes, and appointed a third; but the two former repudiated the authority of the Council, and exercised their functions as before. The Council of Constance (1414–1418) also deposed two rival popes and elected one. In 751, Pope Zachary being consulted as to the right of the warlike French to depose their incompetent king, Childeric, and raise Pepin, the able Mayor of the Palace, to the sovereignty, sanctioned the proceeding. Pepin, in return, became his friend, and handed over to the Church the Exarchate and the Pentapolis. Charlemagne, in 774, confirmed and enlarged the gift. In 1076 or 1077 the Princess Matilda, daughter of Boniface, Duke of Tuscany, made the Holy See heir to her extensive possessions. Thus arose "the States of the Church" which figured on the map of Europe as an independent sovereignty till Sept. 20, 1870, when the troops of Victor Emmanuel, King of Italy, entered Rome, nominally in the interests of order, and took possession of the place for the Italian Kingdom. On July 2 and 3, 1871, the seat of government was removed thither. It still continues the metropolis. No interference took place with the Pope's purely spiritual authority, but much with his temporal possessions and revenues. [INFALLIBILITY.]

For the year 1891 Wagner & Supan estimated the population of the globe at 1,479,729,000, thus distributed: Europe, 357,379,000; Asia, 825,954,000; Africa, 163,953,000; America, 121,713,000; Australia and Tasmania, 3,270,000; Oceanic Islands and Polar Regions, 7,500,000. Chem.: $C_{20}H_{22}O_8 = C_{13}H_{17}(C_7H_5O)O_7$. Benzoylsalicin. A crystalline substance extracted from the bark, leaves, and root of the Aspen (*Populus tremula*). The aqueous decoction is purified and concentrated, and the salicin allowed to crystallize out. From the mother-liquor carbonate of potassium throws down the populin, which must be recrystallized from boiling water. It forms white silky needles containing two molecules of water; dissolves in 76 parts of boiling water, in 100 parts of cold alcohol, and easily in acids. It is coloured a deep-red, with strong sulphuric acid, and with dilute acids is converted into saligenin, benzoic acid, and glucose

Males, stamens four to thirty; females, stigmas two- to four-cleft; capsule two-celled, loculicidal. Known species eighteen; from the north temperate zone. *Populus alba*, the Great White Poplar or Abele, *P. tremula*, the Trembling Poplar or Aspen, and *P. nigra*, the Black Poplar, are natives of Europe. The first is a large tree with downy, but not viscous buds, roundish, cordate, lobed-toothed leaves, glabrous above, downy and very white beneath, ultimately becoming glabrous on both sides. It grows in moist places and monntain woods. The timber is white, soft, and used only for coarse work. The bark is said to be useful in strangury. The Cottonwood (*P. canadensis*) of the United States, is valued as a timber tree. It is very abundant on the upper Mississippi and Missouri. *P. balsamifera*, the Balsam Poplar or Tacamahac, is grown as a common ornamental tree. *P. candicans*, the Ontario Poplar, has the same balsamic character. *P. hetrophylla*, of the Southern States, is noted for its long leaves, often six inches long. *P. fastigiata*, the Lombardy Poplar, is marked by the closely erect growth of its branches. It is frequently grown as an ornamental tree in the United States. The buds of *P. nigra*, *P. balsamifera*, *P. candicans*, &c., are besmeared in winter with a resinous, balsamic, bitter, aromatic exudation, called Tacamahac, considered to be diuretic, and antiscorbutic. A. *As substantive:*

Art: A fictile material intermediate between glass and pottery, being formed of two substances, fusible and infusible, the latter enabling it to withstand the heat necessary to vitrify the former, thus producing its peculiar semi-translucency. The infusible material is alumina, called kaolin; the fusible substance is felspar, and is called pe-tun-tse, both Chinese terms. There are two kinds, hard and soft (*pâte dure* and *pâte tendre*); the hard body has more alumina and less silex and lime. Oriental porcelain is of two kinds, ancient and modern; the latter class includes imitations and reproductions. The manufacture began in China between 185 B.C. and 87 A.D., and reached its perfection during the Ming dynasty (1368–1644). The rarest Chinese wares are of the Tsin dynasty (265–419 A.D.), the Soui (581–618), and the Thang (618–907)—forms virtually extinct except as copies. The Tcheou porcelain (954–959) is so valued that fragments are worn as personal ornaments. Ware of the Song dynasty (960–1279) is also highly prized. Porcelain came by trade into Persia and Egypt, and was known in Syria in the twelfth century. Marco Polo in the thirteenth century described the Chinese method of manufacture from personal observation. First imported into Europe by the Portuguese in 1520. In Japan the porcelain manufacture began before 27 B.C., with a whiter body and more brilliant glaze than that of the Chinese. It is doubtful if it was ever made in Persia. In Europe, Bottcher, a Saxon chemist, found kaolin while seeking the philosopher's stone; and Augustus II., elector of Saxony and king of Poland, established and placed under his control the famous Meissen factory at the castle of Albrechtsburg in 1710; forty years later 700 men were employed. In Vienna, Stölzel, who escaped from Meissen in 1720, began the Austrian factory, which in 1785 employed 500 men; another was established in Berlin by Frederick the Great. During the eighteenth century, works were begun in Russia, Holland, Denmark, Spain, Portugal, Switzerland, and Italy. In France, soft porcelain was made at St. Cloud in 1695. Comte de Brancas-Lauraguan, in 1758, found kaolin near Alençon, and porcelain was made at St. Yrieux, near Limoges. The Sèvres manufactory was first established at Vincennes in 1740, and moved to Sèvres in 1756. In France, the manufacture of soft porcelain extends from 1695 to 1770, after which date the hard body of Sèvres takes its place. In England, William Cookworthy, a chemist of Plymouth, found kaolin at Tregonning, near Helstone, in Cornwall, and his patent of 1768 was worked at Plymouth for two or three years, when the works were removed to Bristol. At Chelsea

and Bow soft porcelain had been made. These two were transferred to Derby in 1770 and 1776. Bristol had a soft body works in 1753: its best period was from 1774 to 1778. Worcester porcelain dates from 1751: its best period ended with 1783. Porcelain equal in quality and finish to that of Europe is now made in several cities of the United States, particularly in Trenton, N. J., and Cincinnati, Ohio.

The Common Porcupine (*Hystrix cristata*) may be taken as a type of the True Porcupine. It occurs in the south of Europe, and the north and west of Africa, is about twenty-eight inches long, exclusive of the tail, about four inches. It is somewhat heavily built, with obtuse head and short limbs. The head, fore quarters, and under surface are clothed with short spines intermixed with hairs, crest on head and neck, hind quarters covered with long sharp spines, ringed with black and white, and erectile at will. They are but loosely attached to the skin and readily fall out, a circumstance which probably gave rise to the belief that the animal was able to project them at an enemy. It is a purely vegetable feeder, and lives in holes in the rocks, and burrows in the ground. The Porcupines of America comprise two well-marked forms, the Urson (*Erethizon dorsatus*) of the United States, and the prehensile-tailed Tree Porcupine (*Cercobates*) of South America. It is still used by some petrologists as a generic name for all rocks consisting of a felsitic base, with felspar crystals. Rocks of varied mineralogical composition, origin, and of various colours, having however been included under this name, English and most American petrologists use it in its adjectival form only. Thus, any rock in which crystals of felspar are individually developed, irrespective of the mineralogical composition of the whole, is said to be porphyritic.

The head is rounded in front, and the snout is not produced into a beak. The external surface is shining and hairless, dark gray or black on the upper parts, under pure white. It is gregarious in habit, and is often seen in small herds, frequenting the coasts rather than the open seas. It often ascends rivers, and has been met with in the Thames, near Richmond, and in the Seine, at Neuilly. It is found on the coasts of Scandinavia, and ranges as far north as Baffin's Bay and as far west as the coast of the United States. Southwards its range is limited, and it is unknown in the Mediterranean. It feeds on fish, and was formerly esteemed as an article of food. Its only commercial value now is derived from the oil obtained from its blubber. Comm.: A species of red wine, produced chiefly in the mountainous districts of Portugal, and shipped from Oporto. After the juice has been pressed from the grape, and fermentation fairly started, a certain quantity of spirit is added to impede the process, so as to retain in the liquid some of the saccharine matter, as well as the flavour of the grape. A good port-wine should possess body and aroma, a full and rich colour, moderate fruitiness, and be neither too sweet nor too rough. The proportion of proof-spirit varies from 26 to 36 per cent. It is frequently adulterated, both before it reaches this country and after its arrival here, sometimes by the addition of inferior wines or elderberry juice, at other times by diluting with water, adding a cheap spirit, and restoring the colour by means of logwood or some other dye. A little powdered catechu is also occasionally added to produce a rough and astringent flavour and to ensure a fine crust.

possession-theory, *s.*

Anthrop.: The theory prevailing among races and individuals of low culture that disease, whether bodily or mental, is due to the presence of a malevolent spirit. [OBSESSION, ORACLE.]

"That the intruding or invading spirit may be either a human soul, or may belong to some other class in the spiritual hierarchy, countenances the opinion that the *possession-theory* is . . . modelled on the ordinary theory of the soul acting on the body. In illustrating this doctrine from typical examples from the enormous mass of available details, it will be hardly possible to discriminate among the operating spirits, between those which are souls and those which are demons, nor to draw an exact line between obsession by a demon outside, and possession by a demon inside."—*Tylor: Prim. Cult.* (ed. 1873), ii. 125.

***4.** A fixed or established place on a line of road where horses were kept for travelling; a stage, a station, a posting-house. Also, a person who travelled by posting, or using relays of horses; a quick traveller, a courier.

¶ Posts seem to have been first established for the conveyance of government messengers or private travellers rather than of letters. The ancient system extensively existed in the provincial parts of India till the introduction of railways narrowed the sphere of its operations. An important traveller, wishing to go to Europe, wrote to the European authorities of the district, who sent out instructions to the heads of the several villages to have relays of bullocks or palanquin bearers at fixed stages along the intended line of route. If he arrived too late he had demurrage to pay to all who lost time waiting for him. Till recently the same system, but with post-horses, extensively prevailed in the West. In Europe it was generally a government monopoly; in England it was conducted (and more effectively) by private enterprise. [6.]

"Letters, especially those to the delivery of which in the ordinary course of *post* importance is attached."—*Daily Telegraph*, Dec. 17, 1885.

¶ Cyrus, the founder of the Persian empire, is credited with the first use of posts for letters. Probably the earliest were government despatches; then private letters would be taken surreptitiously, and finally arrangements would be made for doing so as a government monopoly. Despatches sent by Ahasuerus (Xerxes ?) throughout the Persian empire are mentioned in Esther i. 22; iii. 12-15; viii. 5-10, 13, 14; ix. 20, 30. They were by posts, *i.e.*, men riding on mules and camels (viii. 14). Augustus Cæsar had similar posts in Rome. Charlemagne seems to have introduced them into France. [Post-office.]

1. An office or house where letters, &c., are received for transmission by post to their several addresses, and whence letters, &c., are sent out to be delivered to the addresses.

2. A department of the government having charge of the conveyance of the public mails.

¶ James I., in 1619, established a post-office, and Charles I., in 1635, a letter-office for England and Scotland, but these extended only to the principal roads, and the times of carriage were uncertain. In the latter year the charge for a single letter under eighty miles was 2d., under 140 it was 4d., above 140 it was 6d., on the borders, and in Scotland 8d. The parliament of 1643 framed the Act which provided for the weekly conveyance of letters into all parts of the kingdom, and a regular post-office was erected closely resembling that now existing, and with rates of postage which continued till the days of Queen Anne. In 1839 Rowland Hill brought forward his scheme for a penny postage throughout the United Kingdom. It came into operation on Jan. 10, 1840, on the scale of a penny for every letter below half an ounce in weight. In 1839 the number of letters carried was 75,907,572. The first year of the reduced tariff it rose to 168,768,344, and has since continued to advance year by year, proportionately quicker than the population. The postal service in the United States had its beginnings in 1639, when a house in Boston was authorized to receive and deliver foreign letters. In 1672 New York colony established a monthly post with Boston, which, in 1702, was changed to a fortnightly. A post-office was established in Virginia in 1692, and in Philadelphia in 1693, and a Deputy Postmaster-Geueral for America was appointed in 1692. The system established proved a failure, as it created a monopoly which included also the transportation of travellers. In 1753 Benjamin Franklin was made Postmaster-Geueral for the colonies, and managed the service with much success. When he was removed in 1774 the office yielded a net annual revenue of over $15,000. In 1789, when the new federal government assumed control of the post-office department, there were only 75 offices in the thirteen states. In the succeeding century the progress was remarkable, and in 1890 the offices had increased to 62,401, and the gross cost of handling the mails to $66,645,083. The number of letters, post cards, &c., carried was 2,289,950,015; of uewspapers, 778,428,515; aud of other articles, 519,247,199; while more than 376,000,000 articles were carried free of postage. The number of post-offices in the United States is larger than in any other country. It provides a post-office to every 1003 persons, while Great Britain provides one to every 2105 persons. One result is that the department here is carried on at a loss, while in Great Britain it is a source of revenue. In Great Britain the post-office department owns and works the electric telegraphs. This innovation has not been introduced into the United States.

1. *Chem.:* A term applied to the hydrate of potassium, KHO, either in the liquid or solid state, but sometimes used to denote potassium oxide and also crude carbonate of potassium. Pure or anhydrous potash can be procured by heating thin slices of the metal potassium in air perfectly free from moisture or carbonic acid. It is white, caustic, and very deliquescent. When moistened with water it becomes incandescent and no degree of heat seems sufficient to expel the water. This substance is of slight importance compared with hydrated potash. Important salts of potash are the carbonate, the sulphate, the nitrate, &c. With oils potash forms soft-soaps, and is of great value from its cleansing properties.

2. *Pharm.:* Potash salts are essential constituents in the human body, but if, when wasted, they are supplied directly to the blood they are very poisonous. A much diluted solution of potash is antacid and sedative in dyspepsia and cutaneous diseases, also in pleuritis, pericarditis, scrofula, &c. [BICARBONATE.] Caustic potash is used externally as a caustic in ulcers, &c.; carbonate

of potash has been given in whooping cough; acetate of potash, nitrate of potash, and, in small doses, tartrate of potash are diuretics; acid tartrate of potash is purgative and used in dropsy; citrate of potash is diuretic and febrifugal; sulphate of potash is a mild purgative generally given with rhubarb, &c.; nitrate of potash and chlorate of potash are refrigerants and diuretics. [PERMANGANATE.] Bromide and iodide of potassium are the forms in which bromine and iodine are often administered. Sulphurated potash in small doses is a stimulant, diaphoretic, and expectorant, and is sometimes used in scabies, psoriasis, chronic rheumatism, and bronchitis.

Tripotassamide, or nitride of potassium, K_3N, is obtained when monopotassamide is heated in a close vessel. It is a greenish-black substance, taking fire spontaneously when exposed to the air. In contact with water it is decomposed, yielding ammonia and potassium hydrate.

pŏ-tăs'-sĭc, *a.* [Mod. Lat. *potass(ium)*; Eng. adj. suff. *-ic*.] Of or pertaining to potassium; containing potassium.

pŏ-tăs'-sĭ-ŭm, *s.* [Latinised from *potash* (q.v.).]

Chem.: Symbol. K: atomic weight, 39. A monad metallic element, discovered by Davy in 1807, and very widely diffused through the vegetable, mineral, and animal kingdoms. It usually exists in combination with inorganic and organic acids, and, when its organic salts are burnt, they are resolved into carbonate, from which all the other salts of potassium can be prepared. It may be obtained by electrolysis, but is now produced in large quantity by distilling in an iron retort an intimate mixture of charcoal and carbonate of potassium, a condition readily obtained by igniting crude tartar in a covered crucible. It is a bluish-white metal; sp. gr. ·865, being the lightest of all the metals except lithium. At 0° it is brittle and crystalline; soft at 15°, and may be easily cut with a knife; fluid at 62·5°, and at a red heat distils, yielding a beautiful green vapour. Thrown upon water, the metal decomposes it with great violence, forming hydrate of potassium, whilst the escaping hydrogen takes fire, burning with a rose-red colour. It can only be preserved in the metallic state by immersing it in rock oil.

¶ Potassium-chloride = *Sylvite*; Potassium-nitrate = *Nitre*; Potassium-sulphate = *Aphthitalite* and *Misenite*.

potassium-alloys, *s. pl.*

Chem.: Alloys formed by fusing other metals with potassium. The arsenide and antimonide (the only important forms), heated with the alcoholic iodides, yield the arsenide, &c., of the alcohol radicals.

potassium-bromide, *s.*

Chem.: KBr. Formed by the action of bromine on potassium, or by neutralising hydrobromic acid with potash. It crystallizes in brilliant cubes, having a sharp taste; sp. gr. 2·69; is more readily soluble in hot than in cold water, and is slightly soluble in alcohol. By oxidising agents it is converted into bromate.

potassium-carboxide, *s.*

Chem.: $K_2C_2O_2$. A highly explosive compound formed sometimes in the manufacture of potassium, and when potassium is heated to 80° in presence of carbonic oxide. It is first of a gray colour, and then becomes dark red. The gray compound has the composition K_2CO; the red body can be preserved under mineral naphtha. In contact with water it explodes with great violence.

potassium-chloride, *s.*

Chem.: KCl. Occurs native as sylvite, and is formed when potassium is burned in chlorine, and when potash or carbonate of potash is neutralized with aqueous hydrochloric acid. It crystallizes mostly in cubes, rarely in octahedrons; sp. gr. 1·95; tastes like common salt, melts at a low red heat, and at a higher temperature volatilizes unchanged. It is very soluble in water, one part of the salt dissolving in 2·85 parts of water at 15·5°; is slightly soluble in strong alcohol, but wood spirit dissolves it more readily. It forms crystallizable double salts with most of the metallic chlorides.

potassium-ethyl, *s.*

Chem.: C_2H_5K. Not known in the separate state, but in combination with zinc-ethyl by treating that compound with potassium.

potassium-hydrate, *s.*

Chem.: KHO. Potash. Potassa. Caustic potash. Produced by dissolving protoxide of potassium in water, but generally prepared by adding two parts of quicklime, slaked with water, to a solution of one part of carbonate of potassium in twelve parts of water, and boiling the mixture for some time. After standing, the clear liquid is siphoned off and evaporated in iron or silver basins. To remove several of the impurities it is subsequently treated with alcohol. After fusion it is a white, hard, brittle substance, sp. gr. 2·1, melts below redness to a clear liquid, volatilizes at a red heat, dissolves in half its weight of water, and in nearly the same quantity of alcohol. It has an acrid taste, is a powerful caustic, decomposes most metallic salts, and at a high temperature acts with great energy on nearly all substances.

potassium-iodide, *s.*

Chem.: KI. Obtained by direct union of iodine and potassium, and by neutralizing hydriodic acid with potash. It crystallizes in cubes, which are sometimes transparent, often opaque; sp. gr. 2·90. It has a sharp taste, melts below a red heat, and at a moderate red heat volatilizes without change; is soluble in ·7 part of water at 16°, and in 5·5 parts alcohol at 12·5°. A solution of this salt dissolves free iodine, forming a dark-brown solution. It is much used in medicine.

potassium-oxides, *s. pl.*

Chem.: Potassium forms three oxides: (1) Protoxide, K_2O, formed when potassium is exposed to dry air at ordinary temperatures, is white, very deliquescent and caustic, and unites with water so energetically as to produce incandescence; (2) Dioxide, K_2O_2, is formed at a certain stage in the preparation of the tetroxide, and when the latter substance is decomposed with water; (3) Tetroxide, K_2O_4, is produced when potassium is burnt in dry air or oxygen. It is a chrome yellow powder which is reduced to protoxide when heated in an atmosphere of nitrogen, and to the dioxide when dissolved in water, oxygen in each case being evolved.

potassium-sulphides, *s. pl.*

Chem.: Potassium unites with sulphur in five different proportions: K_2S, protosulphide, obtained, but in a state of doubtful purity, by igniting sulphate of potassium in a covered crucible with finely divided carbon. It has a reddish-yellow colour, is deliquescent and caustic. K_2S_2, disulphide, formed by exposing the sulphydrate to the air, is obtained as an orange-coloured fusible substance. K_2S_3, trisulphide, obtained by passing the vapour of carbonic disulphide over ignited potassium carbonate. K_2S_4, tetrasulphide, formed by reducing sulphate of potassium by means of the vapour of carbonic disulphide. K_2S_5, pentasulphide, obtained from any of the above sulphides by boiling them with excess of sulphur until fully saturated. All the sulphides have an alkaline reaction and smell of sulphydric acid.

Bot., Hort., Agric., &c.: Solanum tuberosum, a well-known plant, the tubers (dilated branches) of which are eaten. It is a native of Chili and Peru. Some think that it was first brought to Spain from the mountains near Quito early in the sixteenth century. Thence it spread to Italy and Austria. Sir Walter Raleigh is supposed to have brought it to England in July, 1586, having obtained it from the Virginian colonists whom he had taken out in 1584. Gerarde, in his *Herbal*, figured it in 1597 as "the potatoe of Virginia," whence he said he had obtained its roots. Sir Walter Raleigh cultivated potatoes on his estate of Youghal, near Cork. For the next century and a half they were regarded as garden plants only. In Scotland they were not cultivated as a field crop till 1732. They gradually made way to the important position which they now occupy in general agriculture. Many varieties are grown, differing in earliness, form, size, colour, &c. They are sometimes preserved through the winter in pits dug in the ground, and lined with straw. A raw potato scraped is a good application to burns and scalds. [POTATO-STARCH.]

potato-disease, *s.*

Veg. Pathol.: A disease or murrain produced by a fungus, *Peronospora infestans*. It generally first attacks the leaves and stems of the plant, forming brown spots upon them in July and August. By this time, the fungus which first penetrated the tissue of the leaf, has thrust forth through the stomates its conidia-bearing filaments. The leaves soon afterwards die. Next the tubers are attacked and decay, either in a moist manner, attended by a disagreeable odour, or by a drying up of the tissue. Sometimes the term potato-disease is limited to the first of these kinds of decay, but they are closely akin, the one form passing into the other. Possibly an excess of rain in particular seasons created a predisposition to the attacks of the fungus. Too strong manuring, and the cutting up of seed potatoes have also been suggested as predisposing causes. The potato-disease first appeared in America. In 1845–1847 it caused the failure of the potato crop in Ireland, producing famine. [FAMINE.] It has never since completely disappeared, and in 1860 was nearly as formidable in some places as on its first appearance. When it is prevalent, the potatoes should be powdered with flowers of sulphur before being planted. They should be put early in the ground, and the haulm removed when the disease manifests itself.

They appear to have been formed in the dolomitic conglomerates. According to Green, this name has also been applied to certain hollow limestone pebbles, which have been converted into dolomite, their interiors being lined with crystals of the same substance.

B. to be forewarned (to appear and answer the contempt with which he is charged) (16 Richard II., c. 5). The original offence against which the Statute of Præmunire was directed was that of asserting the jurisdiction of the pope in England, and denying that of the king. But by subsequent statutes the penalties of præmunire have been extended to many other offences of a miscellaneous kind. Thus by 25 Henry VIII., c. 20, refusal to elect, confirm, or consecrate a prelate named by the king, incurs these penalties. They are also incurred by any officer of a court practising without having taken the proper oaths. These penalties are declared by Sir E. Coke to be, "that from the conviction, the defendant shall be out of the king's protection, and his lands and tenements, goods and chattels, forfeited to the king; and that his body shall remain in prison at the king's pleasure; or, as other authorities have it, during life."

When the patricians were compelled to acquiesce in the consulship being thrown open to the plebeians, they stipulated that a new Curule magistrate should be appointed from the patricians exclusively, to act as supreme judge in the civil courts. On this magistrate the title of Prætor was bestowed. In B.C. 337, the Prætorship was thrown open to the plebeians. About B.C. 240, the number of aliens residing in Rome had increased to such an extent that it was found necessary to appoint a second Prætor, who should decide suits between aliens or between aliens and citizens. He was known as the *Prætor peregrinus*, the other Prætor, *Prætor urbanus*, having cognizance of suits between citizens only. In B.C. 227, the number was increased to four, the two additional prætors to act as governors of provinces. By Sulla the number was augmented to eight, by Julius Cæsar to ten, twelve, and eventually to sixteen. The Prætors held their offices for one year, and were afterwards sent out by lot as governors of provinces.

¶ *Precession of the equinoxes:*

(1) *Astron.:* The going forward of the equinoxes. The arrival of the sun at the point Aries a little earlier than he might be expected to reach it was first observed by Hipparchus about 150 B.C. Depending, as the phenomenon does, for its explanation, on the law of gravity, Hipparchus could not account for it. Sir Isaac Newton was the first who did so, and that his newly discovered law of gravitation explained the precession of the equinoxes was a confirmation of the accuracy with which he had read the law itself. Excepting only at the two equinoxes, the plane in which the sun moves in his orbit and that in which the earth rotates do not coincide. By the law of gravitation one body does not attract another in mass, but acts on its separate particles. The sun then does not attract the earth as a whole, but tends to pull the parts nearest it away from those in proximity to the centre, and the centre again away from those on the other side. The bulged-out equatorial zone is specially liable to be thus acted upon, and, but for the rotation of the earth, would be so drawn down towards the ecliptic that it and the equator would ultimately be in one plane. The earth's rotation, however, modifies this action, and simply causes the points at which the earth's equator intersects the plane of the ecliptic to move slowly in a direction opposite to that in which the earth rotates. This is what is denominated the precession of the equinoxes. It is generally associated with the sun, but the moon is twice as potent in producing it; owing to her comparative nearness to the earth she is able to produce a greater differential effect on the nearer and more remote portions of our planet. The annual motion of the first point of Aries is about 50″, and about 25,867 years will be required for the entire revolution. [Aries.]

"The portion of the *precession of the equinoxes* attributable to the sun is called solar precession, and that produced by the moon lunar precession."—*Prof. Airy: Pop. Astron.* (ed. 6th), p. 269.

4. "But yours the waift by high *prerogative*."
Spenser: F. Q., IV. xii. 31.

II. *Eng. Law:* An exclusive privilege of the Crown, the expression *the* prerogative being employed for the whole or any part of such exclusive privilege. The prerogative may be confined or limited by the supreme legislative authority, and has in fact been much restricted, notably by Magna Charta (1215), the Habeas Corpus Act (1679), the Bill of Rights (1628), and the Act of Settlement (1639). The chief existing prerogatives are

1. *Personal:* In order that the State may never be without a ruler and head, the sovereign is regarded as a corporation; he cannot die, nor can he be under age. He is personally irresponsible for any crime, the responsibility of his acts resting on his ministers. He cannot be guilty of negligence. No lapse of time will bar his right to prosecute; though in civil matters he cannot sue after a lapse of sixty years. He is exempt from taxation and tolls; his person cannot be arrested, nor his goods distrained upon. The palaces which he uses as dwellings are exempt from taxation, as is the disused Holyrood House, whose precincts still afford sanctuary from civil process.

2. *Political:* All land in theory is held of the king. He can dissolve or prorogue parliament, but cannot prolong it beyond seven years. He can refuse assent to a Bill passed by both Houses. He can, with the advice of his Privy Council, issue proclamations, binding only, however, in so far as they do not clash with existing laws. He is not bound by an Act of Parliament unless expressly named there in. He can prevent a subject from leaving the kingdom, by a writ of *ne exeat regno*, and compel the return of a subject from abroad. He is the fountain of honour, and by 13 Car. II., c. 6, in him is vested the command of the army and navy. He alone can coin money, grant charters to corporations, and establish markets and fairs. He is guardian of lunatics, idiots, and infants.

3. *Judicial:* The king is the fountain of justice, and the Supreme Court of Appeal, but he cannot erect tribunals contrary to the law, nor can he add to the jurisdiction of courts. He may intervene in all litigation where his own rights are concerned, or the interests of public justice demand it.

4. *Ecclesiastical:* The statutes 26 Henry VIII., c. 1 and 1 Eliz., c. 1 recognise the king as the Supreme Head of the Church. He convenes and dissolves Convocation (q.v.) and nominates to vacant bishoprics (Bishop, Congé d'élire), but he can erect no new see in England, though he may do so in the Crown colonies.

5. *Fiscal:* A few unimportant feudal dues are still the prerogative of the king; as in the case of treasure-trove, escheats, royal fish, wrecks, waifs, and strays, &c.

In theory all these privileges fall within the prerogative of the Crown; yet, with the exception of such as are purely personal, and the conferring of honours (which are usually conferred on the initiative of the Premier), they are exercised by the responsible minister of the Crown, chosen from that party which has, for the time being, a majority in the House of Commons.

* **prerogative-court**, *s.* An ecclesiastical court for the trial of testamentary causes, where the deceased had left effects in two different dioceses. It was abolished, and its jurisdiction transferred to the Court of Probate by the Act 20 & 21 Vict., c. 77.

B. *As substantive:*

Church Hist. & Ecclesiol. (*Pl.*): Those who believe that the government of the church by means of presbyters is "founded on and agreeable to the word of God." They hold that presbyter (elder) and bishop are different names for the same ecclesiastical functionary (cf. Acts xx. 17, 28, R.V., Phil. i. 1, &c.); that, consequently, every presbyter is a bishop, and on a footing of equality with his other brethren in the eldership. Presbyters are divided into two classes—teaching and ruling elders (1 Tim. v. 17). The former are popularly called "ministers," the latter "elders," or "lay-elders;" but, theoretically, both hold spiritual office. The government is by means of four courts of judicature, rising consecutively in dignity and authority. The lowest—called in Scotland, &c., the "Kirk-session," or simply the "Session" [Kirk-session], rules over the congregation in all spiritual matters; while finance, being deemed more secular, is relegated to deacons or

managers. Above the Session is the Presbytery (q.v.). Above this again is a Synod for a province; it is held half-yearly. Highest of all is the General Assembly, meeting annually. The minister of a congregation presides *ex officio* in the Session, and non-ministerial elders are ineligible for the Moderatorship of the Presbytery, Synod, and Assembly. A Presbyterian denomination stands to an Episcopal one nearly in the same relation as a republic to a monarchy. The Waldensian church was constituted on an essentially presbyterian model. The system was partially introduced into Switzerland in 1541, and its discipline was subsequently carried out by Calvin with iron firmness at Geneva. The first French Synod met in Paris in 1559, the first Dutch Synod at Dort in 1574. The Hungarian and various other continental Protestant churches are also Presbyterian. The system thoroughly rooted itself in Scotland, the first General Assembly being held there in 1560. [CHURCH OF SCOTLAND.] The same year a presbytery was formed in Ireland, at Carrickfergus [SYNOD OF ULSTER], and in 1572 one in England, at Wandsworth. In 1646–7 the Church of England was reconstituted on a presbyterian basis, but in 1660 was again made episcopal. [CHURCH OF ENGLAND.] The first Presbyterian congregations in the American colonies were organized in Maryland, that of Rehoboth about 1690. The first Presbytery met in Philadelphia in 1705. The earliest members were immigrants from Scotland and Ireland. A synod, composed of four Presbyteries, was organized in 1716. In 1758 the American Presbyterian churches, which had been divided by dissensions, were re-united, and in 1788 a General Assembly was instituted. At that date there were 419 congregations, with 188 ministers. The church grew rapidly in the United States. In 1834 it had 22 synods and about 1900 ministers. In 1838 a division took place, the church dividing into the Old School and New School Presbyterians, the former holding high Calvinistic doctrines, the latter a modified Calvinism. A union between these divisions was accomplished in 1869. There are several divisions of the Presbyterian church in the United States, each with a special title, and having its own theological colleges and seminaries. In 1890 there were in all 13,619 churches with a membership of 1,229,012.

The Jewish priests filled all the important offices in connection, first with the tabernacle and then with the temple worship, less important ones being handed over to the Levites, and those still more menial to the Nethinims (q.v.). They constituted a sacred hierarchy, of which the high priest was the head. Their chief duties were to offer sacrifices for themselves and the people, and intercede for them with God. The priests were divided into twenty-four courses for the service of the temple (1 Chron. xxiv. 1–19; Luke i. 5). Probably the "chief priests" were the heads of these courses, with any high priest out of office (Matt. xxvi. 3).

Zool.: The first and chief of Linnæus's orders of the class Mammalia. He divides it into three sub-orders: (1) Anthropidæ, (2) Simiadæ (Apes and Monkeys), and (3) Lemuridæ.

"Moreover, as man is the highest animal, and zoologically considered, differs less from even the lowest ape than such ape differs from any other animal, man and apes must be placed together in one order, which may well bear its primitive Linnæan name, *Primates*."—*Prof. Mivart*, in *Encyc. C. *As substantive:*

1. The act, process, or practice of impressing letters, characters, or figures on paper, cloth, or other material; the business of a printer; typography. There are several branches of the art, as, the printing of books, &c., by means of movable types; the printing of engraved steel or copper plates [ENGRAVING]; the taking impressions from stone [LITHOGRAPHY], and the printing of figured patterns on fabrics [CALICO-PRINTING]. Letterpress-printing, or the method of taking impressions from type or letters, and other characters cut or cast in relief upon separate pieces of metal, is the most important branch of printing. Printing in its earliest form consisted in taking impressions from engraved blocks. [BLOCK-BOOKS, BLOCK-PRINTING.] The use of separate types was invented by Guttenberg, of Mentz, about the year A.D. 1450. In company with Faust and others he printed several works with wooden types and wooden blocks. These were the *Alexandri Galli Doctrinale* and *Petri Hispani Tractatus* in 1442, and subsequeutly the *Tabula Alphabetica, Catholicon, Donati Grammatica,* and the *Confessionalia,* between the years 1444 and 1450. In the years 1450-55, the Bible of 637 leaves was printed by Guttenberg and Faust with cut metal types. Gutteuberg died in 1468, in high honour for his genius and perseverance. Faust, after dissolving partnership (1455) with Guttenberg, became allied with Schoeffer; and they published in 1457 the *Codex Psalmorum* with metallic types—the most ancient book with a date and inscription. Cast metallic types were invented by Schoeffer in 1459. As first practised in Europe the sheets were printed on one side only, and the backs of the pages pasted together. The art of printing was introduced into France in 1469; Italy, 1465; Spain, 1477, and England (by Caxton) in 1474. In letterpress printing the impressions are taken directly from the surface of the types, or from stereotyped plates [STEREOTYPE] by superficial pressure, as in the hand printing-press, or by cylindrical pressure, as in the steam printing-machine, or by the action of a roller, as in the copper-plate press. The ink or pigment employed is laid upon the surface of the type with a printer's roller. Printing is divided into two departments, composition and press-work. (See these words.) In printing for the blind the letters or characters are impressed in relief on stout paper or cardboard without the use of ink.

2. *Photog.:* The process of obtaining proofs from negatives. [AUTOTYPE, PHOTOCOLLOTYPE, PLATINOTYPE, POWDER-PROCESS, SILVER-PRINTING, STANNOTYPE, WOODBURYTYPE.]

printing-machine, *s.* A machine for taking impressions on paper from type, electrotype, or stereotype forms, steel or copper plates, lithographic stones, &c. It is moved by hand, or by steam, or other power. The impression from the forms is generally effected by cylindrical pressure. Letterpress printing machines are of three kinds: (1) Single cylinder, by which the sheet of paper is printed on one side only; (2) Perfecting, which prints both sides of the sheet at one operation; and (3) Platen, which prints one side of the sheet by flat, instead of cylindrical, pressnre. There are also various kinds of Rotary machines used for printing newspapers, into which the paper is drawn from reels, instead of being fed by single sheets. The first cylinder printing-machine was patented by W. Nicholson in 1790. In 1814 the London *Times* was for the first time printed by machinery, at the rate of 1,100 copies per hour, by a machine invented by König. Of the later presses, the most celebrated is that invented by Hoe, of New York, which has been successively improved, and remains to-day the fastest and most satisfactory press made. The best of these machines print four to six page papers at the extraordinary speed of 48,000 impressions per hour. In this country it is termed a printing press.

printing-paper, *s.* Paper used in printing books, papers, &c., as distinguished from writing-paper, wrapping-paper, &c. [PAPER.]

A contrivance for running the forme in and out was afterwards added. In the printing-press the matter to be printed is laid on an even horizontal surface, usually of iron, and the pressure is produced by a parallel surface, also usually of iron, called a platen, by means of a screw or lever, or both combined.

A conventual prior is the head of a religious house, either independently, as among the Regular Canons, the Carthusians, and the Dominicans, or as superior of a cell or offshoot from some larger monastery. privy-council, *s.* The principal Council of a British sovereign, made up of members chosen at his or her pleasure. Its dissolution depends upon the royal pleasure; by common law it was dissolved *ipso facto* by the demise of the sovereign, but to prevent the inconvenience of having no council in being at the accession of a new prince, the privy council is enabled by statute to continue for six months after the demise of the crown, unless sooner dissolved by the successor. It is presided over by the Lord President of the Council, who has precedence next after the Lord Chancellor. Members of the privy council are addressed as Right Honourable. The duty of a privy councillor appears from the oath, which consists of seven articles:

1. To advise the king according to the best of his cunning and discretion; 2. To advise for the king's honour and good of the public, without partiality through affection, love, meed, doubt, or dread; 3. To keep the king's counsel secret; 4. To avoid corruption; 5. To help and strengthen the execution of what shall be there resolved; 6. To withstand all persons who would attempt the contrary; and lastly, in general, 7. To observe, keep, and do all that a good and true councillor ought to do to his sovereign lord.

The office of a privy councillor is now confined to advising the sovereign in the discharge of executive, legislative, and judicial duties. The former have, since the accession of Queen Anne, been entrusted to responsible ministers; and it has consequently become the settled practice to summon to the meetings of the council those members of it only who are the ministers of the crown. The power of the privy council is to inquire into all offences against the government, and to commit the offenders for trial; but their jurisdiction is only to inquire and not to punish, except in the case of the judicial committee, which has full power to punish for contempt and to award costs. The duties of the privy council are, to a great extent, performed by committees, as the judicial committee, who hear allegations and proofs, and report to the sovereign, by whom judgment is finally given, and the committee of council on education, presided over by the Vice-president of the Council, who is a member of the government.

From Medina's death till about 1650 Probabilism flourished, and then a reaction set in in favour of Probabiliorism (q.v.). St. Alphonsus Liguori (1732-87) in his *Homo Apostolicus* and *Theologia Moralis* revived Probabilism, which is now the ordinary rule of confessors in the Roman Church.

3. *Law:* A term applied to the whole course of proceedings in a cause, real or personal, civil or criminal, from the original writ to the end of the suit; properly, the summons citing the party affected to appear in court at the return of the original writ. This was sometimes called original process, being founded upon the original writ; and also to distinguish it from mesne or intermediate process, which issues, pending the suit, upon some collateral interlocutary matter; as to summon witnesses, and the like. Mesne process is also sometimes put in contradistinction to final process or process of execution; and then it signifies all such process as intervenes between the beginning and end of a suit. Formerly the English common-law courts differed greatly in their mode of procedure in the case of personal actions: thus, in the Court of Queen's Bench a plaintiff might proceed by original writ, but the more usual method was by a species of process entitled a Bill of Middlesex, so entitled because the court generally sat in that county. In the Exchequer the first process was by a writ of *quo minus*, in order to give the court a jurisdiction over pleas between party and party, in which the plaintiff was alleged to be the king's farmer or debtor, and that the defendant had done him the injury complained of, *quo minus sufficiens existit*, by which he was the less able to pay the king his rent or debt. And upon this the defendant might have been arrested as upon a capias from the Common Pleas. By the Process Uniformity Act, the procedure in all personal actions except replevin, is the same in all the courts, and all actions are now commenced by a writ of summons, under the seal of the court in which the action is brought, directed to the defendant, and commanding him to cause an appearance to be entered for him on a certain day. In ecclesiastical suits the mode of commencing an action is by process termed a citation or summons, containing the name of the judge, the plaintiff, and the defendant, the cause of complaint, and the time and place of appearance. The rules of English law, here given, have been somewhat closely followed in the United States.

¶ *Procession of the Holy Ghost:*

1. *Theol.:* The noun procession is not found in Scripture, it was, however, legitimately framed by theologians from the verb occurring in John xv. 26, "The Spirit of truth, which proceedeth from the Father." There is no similar passage categorically stating procession from the Son, and the question arises, can equivalent language be found? If the words in John xiv. 26, "The Comforter, which is the Holy Ghost, whom the Father will send in my name," imply the procession of the Holy Ghost, so do those in xv. 26, "But when the Comforter is come, whom I will send unto you from the Father," and there is a Procession of the Holy Ghost from the Son as well as from the Father, if they are not equivalent there is no procession from the Son. (Cf. Gal. iv. 6.)

2. *Church Hist.:* The clause "filioque" [Nicene creed], implying procession from the Father and the Son, being accepted in the West while rejected in the East, was one potent cause of the ultimate separation between the Greek and Latin Churches. [Greek-church.] The clause was accepted by the Reformed Churches and by Nonconformists generally, and appears in the Presbyterian Confession of Faith (ch. ii., § 3).

Thus if *a*, *b*, *c*, *d*, &c. be such a series that $a : c :: a-b : b-c$; $b : d :: b-c : c-d$, and so on; then the series *a*, *b*, *c*, *d*, &c. forms an Harmonical Progression.

¶ (1) *Promise and offer:*

Scots Law: An offer is a proposal made by the offerer to the person to whom the offer is addressed, to give or to do something either gratuitously or on an onerous consideration. A promise is an offer with this addition, that

the promiser, from the nature of his proposal, thinks it unnecessary to wait for the other party's assent, which he takes for granted. An offerer is not bound until his offer is accepted. A promiser is bound as soon as the promise reaches the party to whom it is made. A promise may be absolute or conditional, lawful or unlawful, express or implied. An absolute promise must be fulfilled in all events. The obligation to fulfil a conditional promise depends on the performance of the condition. An unlawful promise is not binding, being void by the nature of it, as being incompatible with a prior paramount obligation of obedience to the laws. An express promise is one expressed in words or writing. An implied promise is one which reason and justice dictate. A promise without deed is said to be parol, and the term is usually applied to engagement by parol only, a promise by deed being technically called a covenant (q.v.).

Then every minister successively, beginning with the youngest, did handle one and the same part of Scripture."—*Bacon: Pacification of the Church.*

* 2. An interpreter, a spokesman.

"I have made thee a god to Pharaoh: and Aaron thy brother shall be thy *prophet*."—*Exodus* vii. 1.

¶ 1. *The Prophets:*

(1) Men diviuely inspired, and who often uttered predictious of future events. Three words are applied to the Old Testament prophets; the most common is נָבִיא (*nabhi*), from the verb נָבָא (*nabha*) = primarily, to bubble forth, to send forth copious floods of speech, hence in Niphal = to speak under a divine impulse, to prophesy (1 Sam. ix. 9; 1 Kings xx. 13); the second רֹאֶה (*roeh*) = a seer, from רָאָה (*raah*) = to see (1 Sam. ix. 9), and the third חוֹזֶה (*chhozeh*) = a seer, from חָזָה (*chhazah*) = to see, to look (1 Chron. xxi. 9; xxv. 5, &c.). It is connected with חָזוֹן (*chhazon*) = a vision. The second term was the oldest (1 Sam. ix. 9). Both it and *chhozeh* suggest that the subjects of the prophecies passed before the eyes of the seer in panoramic vision (cf. Isaiah i. 1; Ezek. i. 4; Rev. i. 12), he simply recording what he saw. In many cases, however, words were communicated (Jer. i. 4, 9, 11, 12). The first word *nabhi*, suggested that when inspired communications had to be made, the prophet, like a frenzied person raving, uttered words in a copious flood, flowing forth with some considerable impulse. Abraham is called a prophet (Gen. xx. 7); it is implied that Moses was one (Deut. xviii. 15; Acts vii. 37), but the more typical prophets began with Samuel (Acts xiii. 20), who was a civil ruler as well. Yet the full development of the prophetic order was not till the separation between the two kingdoms. In Judah the general faithfulness to Jehovah left them less scope. In the kingdom of Israel, on the other hand, where the worship, even when nominally that of Jehovah, was idolatrous, and where that of Baal often prevailed, the prophets were very prominent and influential, denouncing apostasy and moral depravity. The first, like Elijah, Elisha, &c. have left no writings; the later prophets have. [(2).] The last of the Old Testament prophets passed away with Malachi, and scribes took their place. In the early church there were prophets (Rom. xii. 6; 1 Cor. xii. 28; Ephes. iv. 11, &c.). Their chief function seems to have been preaching in the church (1 Cor. xiv. 2–5).

(2) The prophetic books of the Old Testament, or the Old Testament except the books of Moses (Matt. xxii. 40; Luke xxiv. 27).

2. *School of the Prophets:* An association of the prophets in which the elder lovingly trained the younger, who were called their sons (1 Kings xx. 35). First Elijah, and then Elisha, presided over such a society.

3. *Math.*: The relation which one quantity bears to another of the same kind, with respect to magnitude or numerical value. This relation may be expressed in two ways: (1) by the difference of the quantities, and (2) by their quotient. When the relation is expressed by their difference, it is called an Arithmetical Proportion; when by their quotient, Geometrical Proportion, or simply Proportion. Four quantities are in proportion when the ratio of the first to the second is equal to the ratio of the third to the fourth; this relation is expressed algebraically thus, $a : b :: c : d$. This expression is called a proportion; it is read, a is to b as c is to d, and is equivalent to the expression $\frac{b}{a} = \frac{d}{c}$. Hence, a proportion may be defined to be the algebraic expression of equality of ratios.

I. *Ordinary Language:*

1. The act of protecting; the state of being protected; defence; shelter from danger, hurt, injury, or evil; preservation from anything hurtful or annoying.

"No one doubts that both sexes of many birds have had their colours adapted for the sake of *protection.*"—*Darwin: Descent of Man*, pt. ii., ch. xvi.

2. That which protects, shelters, or preserves from danger, injury, or evil; a shelter, a defence: as, Clothes are a *protection* against the cold.

4. Exemption from arrest in civil suits. Also, in English legal custom, a special protection given by virtue of the royal prerogative against suits in law or other vexations, in respect of the party being engaged in the sovereign's service.

II. *Polit. Economy:* Protection in this sense is said to have been derived from the name of the Society for the Protection of Agriculture (1844–53). But the idea is old, and has been known to a greater or less extent in all ages and in all lands. Taxes levied solely for the raising of revenue operate in restraint of free trade, and are therefore a form of protection, but the term is generally limited to cases in which these taxes are imposed for other than fiscal purposes. It is believed that the protectionist system on a large scale was first proposed by the Chancellor de Birague, an Italian, in the suite of Catherine de Medici. It was developed by Colbert in 1664, and has not since passed away. In 1692 England retaliated on France, according to Adam Smith, taxing goods imported from that country in 1696 75 per cent. or more. Bouuties were abolished in Britain between 1818 and 1824, and this, with the repeal of the Corn and Navigation Laws. In the United States a protective policy was inaugurated early in the history of the country, and has been maintained in a greater or less degree ever since, the purpose being to protect American manufacturers against European competition, and favor the accumulation of capital and the paying of better wages to workmen. It has long been maintained by a strong party in the country that all the benefit to be derived from this policy has long since been gained, and that open competition with the manufacturers of the world would be more advantageous. The Republican party is based largely on the principle of protection, the Democratic on that of free trade or tariff for revenue only. Both policies have been adopted from time to time, as one or the other party gained the ascendency, but for more than 30 years after 1860 the government remained effectively under Republican control, and the policy of Protection was sustained. In 1893 the Democratic party gained the predominance in the government, and in 1894 a new tariff bill was passed by Congress. In this, however, the principle of protection was largely retained, though various raw materials were admitted free of duty, the most important being wool. A duty was placed on sugar, which had previously been free.

prō′-tō-plăsm, † prō-tō-plăs′-ma, *s.* [Gr. πρῶτος (*prōtos*) = first, and πλάσμα (*plasma*) = anything formed or moulded.]

Biol., &c.: "The living matter from which all kinds of living beings are formed and developed, and to the properties of which all their functions are ultimately referred" (*Encyc. Brit.*, ed. 9th, xix. 828). It was first noticed and described by Rœsel v. Rosenhof, in his account of the Proteus-animalcule, and was named sarcode by Dujardin in 1835. In 1846 v. Mohl gave the name protoplasm to the "tough slimy granular, semi-fluid" portion of the contents of the vegetable cell. Cohn suggested the identity of vegetable protoplasm and animal sarcode, which was established by Schultze (*Arch. f. Anat. u. Phys.* (Leipzig), 1861, pp. 1-27), whose conclusions were probably aided by the researches of De Bary and Koelliker. Protoplasm is a transparent homogeneous, or granular-looking substance. Under high microscopic power, in many instances, it shows a more or less definite structure, composed of fibrils more or less regular, and in some instances grouped into a honeycombed or fibrillar reticulum, in the meshes of which is a homogeneous interstitial substance. The closer the meshes of the reticulum, the less there is of this interstitial substance, and the more regularly granular does it appear. Water, dilute acids, and alkalies cause protoplasm to swell up, and ultimately become disintegrated, and it is coagulated by those substances that coagulate proteids. Its composition is a problem with which science has still to deal.

"It is now known that in the embryo and adult, in plant and animal, vertebrates and invertebrates, all kinds of cells, before their *protoplasm* undergoes divisiou, show complicated change of their nucleus, leading to division."—*Klein: Elements Histology*, p. 7.

I. *Ordinary Language:*

1. "A *proverb* is usually defined, an instructive sentence, or common and pithy saying, in which more is generally designed than expressed, famous for its peculiarity and elegance, and therefore adapted by the learned as well as the vulgar, by which 'tis distinguished from counterfeits which want such authority."—*Ray: Proverbs.* (Pref.)

2. A by-word; an expression or name of contempt, hatred, or reproach. (1 *Kings* ix. 7.)

3. A short dramatic composition, chiefly French, in which some well-known proverb or popular saying is taken as the foundation of the plot.

II. *Scripture:*

1. A moral saying or maxim, enigmatical or allegorical in its nature. (*Proverbs* i. 6.)

2. (*Pl.*) *Old Test. Canon:* Heb. מִשְׁלֵי (*Mishlei*), pl. of מָשָׁל (*mashal*) = (1) a similitude, a parable (Ezek. xvii. 2, xxiv. 3); (2) a pithy saying, generally involving latent comparison; (3) a proverb properly so-called; (4) a song or poem, prophetic (Num. xxiii. 7, 18), didactic (Job xxvii. 1), or derisive (Isaiah xiv. 4), &c. The noun, מָשָׁל (*mashal*), is from the verb מָשַׁל (*mashal*) = to make like, to assimilate. (*Gesenius.*) It was therefore to be expected that the book of Proverbs would not consist exclusively of proverbs properly so called; nor does it. For instance, ch. ii. is not a series of detached sayings, but a didactic treatise. Dr. Otto Zöckler (*Prov. Solomon* (ed. Aiken), pp. 35–37) divides the Book into five leading portions: (1) Introductory (i. 7–ix. 18); (2) original nucleus of the collection, genuine Proverbs of Solomon (x. 1–xxii. 16); (3) additions made before Hezekiah's day (xxii. 17–xxiv. 34); (4) gleanings by the men of Hezekiah (xxv.–xxix.); (5) the Supplements (xxx.–xxxi.), the first being the words of Agur (xxx.), and the second the words of Lemuel, with the poem in praise of the matron (xxxi.). Chapter xxxi. 10–31 constitutes an alphabetical acrostic. Chapters i.–xxix. are generally attributed to Solomon, who was "wiser than all men," and "spake 3,000 proverbs" (1 Kings iv. 31, 32), which do not seem to have been founded solely on his own experience, but on the shrewd observation of the nation at large (i. 6). The collection made under Hezekiah repeats many proverbs which appeared in the earlier one. The lives of Agur and of King Lemuel's mother, and the dates of the two appendices ascribed to them, are unknown. The New Testament directly quotes from this book in very many instances.

Cf. Prov. iii. 11, 12 with Heb. xii. 5, 6, Rev. iii. 19; Prov. iii. 34 with James iv. 6; Prov. xi. 31 with 1 Pet. iv. 18; Prov. xxv. 21, 22 with Rom. xii. 20; Prov. xxvi. 11 with 2 Pet. ii. 22. Allusion is made to Prov. i. 16 in Rom. iii. 15; to Prov. iii. 7 in Rom. xii. 16, and to Prov. x. 12 in 1 Pet. iv. 8.

¶ *The Book of Psalms:*

Old Test. Canon.: Heb. תְּהִלִּים (*techillim* or *tehillim*), an abnormal pl. of masc. form to the fem. תְּהִלָּה (*techillah* or *tehillah*) = (1) praise; (2) a hymn of praise; (3) glory. In one codex the Septuagint calls the book Ψαλμοί (*Psalmoi*) = Psalms; in another Ψαλτήριον (*psaltērion*) = a stringed instrument. It was the praise-book or psalter of the Hebrew temple or synagogues. In the present Hebrew Bibles it is placed just after the Prophets at the head of the Hagiographa (q.v.), and in Luke xxiv. 44, is generally supposed to stand for that division of the Old Testament books. The hundred and fifty psalms are arranged in Hebrew in five books, each terminating with a doxology, in some cases closing with "Amen and amen." The R.V. prints them separately. Book 1 contains i.-xli.; book 2, xlii.-lxxii.; book 3, lxxiii.-lxxxix.; book 4, xc-cvi., and book 5, cvii.-cl. All but thirty-four psalms have titles in the Hebrew Bible: the latter were called by the Rabbins orphan psalms. In the Septuagint all but two have titles. Though not as a rule accepted as part of Scripture, they are ancient, and worthy of high respect. They attribute all Book 1 to David, except Ps. i., ii., x., and xxxiii. The name of the Supreme Being used in this book is chiefly Jehovah. Book 2 assigns Psalms to David, to Korah, to Asaph, and to Solomon, and leaves others anonymous. The name for the Supreme Being in this book is Elohim (q.v.). Book 3 ascribes Psalms to David, to Korah, to Asaph, to Ethan, and to Heman the Ezrahite. Elohim and Jehovah are about equally common in the book, the former, however, being apparently preferred. Book 4 ascribes Psalm xc. to Moses, the others not anonymous to David. Book 5 leaves many psalms anonymous, attributing others to David. The Hebrew Bible, but not the Septuagint, assigns Psalm cxxvii. to Solomon. This volume contains the Songs of Degrees. The book was evidently brought together from many sources. It was commenced, rather than entirely composed, by David. Its compositiou and compilation extended over centuries. Psalm cxxxvii. speaks of the Babylonish captivity as an event recently gone by. Psalm xliv. and lxxix. seem very suitable to the time of the persecutiou under Antiochus Epiphanes (B.C. 168–165). If the Talmudic statement, discovered by Gratz, that the night service alluded to in Psalm cxxxiv. did not become part of the Jewish ritual till the time of Queen Alexandra (B.C. 79–70), it, and perhaps others of the Songs of Degrees may be slightly more recent than that date. The book of Psalms is quoted or alluded to as an inspired composition by Our Saviour and his Apostles at least seventy times: no Old Testament book is more frequently quoted. Its canonical authority has never been seriously doubted. It has become the psalter of the Christian Church. Its rhythmical form and careful parallelism (q.v.) (now rendered obvious by the R.V.) adapt it for the musical part of public worship. [MESSIANIC.]

Chem.: A base said to have been obtained from a cinchona extract of unknown origin. It crystallized in prisms, was insoluble in ether, but soluble in alcohol. It was tasteless, and its sulphate was scarcely bitter.

pseudo-stearoptene, *s.*

Chem. (*Pl.*): A term applied to certain crystalline bodies separated from volatile oils, differing from the true stearoptenes by their greater solubility in water, *e.g.*, primrose camphor from *Primula Auricula*, and the camphors derived from other species of the same genus.

* **pseudo-strata,** *s. pl.*

Geol.: Masses of rock extending in tabular plates, but not laminated. (*MacCulloch.*)

pseudo-sulpho-cyanogen, *s.* [PERSULPHO-CYANOGEN.]

† **pseudo-tinea,** *s.*

Entom.: The larva of certain Moths, spec. the Bee-moth (q.v.).

pseudo-toxine, *s.*

Chem.: A light yellow poisonous extract obtained from belladonna leaves, soluble in water and weak alcohol. It is not a pure substance, and is believed to owe its poisonous properties to the presence of atropine.

pseudo-uric acid, *s.*

Chem.: $C_5H_6N_4O_4$. Formed by the action of potassium cyanate on uramil. The compound is precipitated from its potash-salt by hydrochloric acid as a white powder made up of prisms. It is without taste or smell, is slightly soluble in water, and forms crystalline salts with the alkalis and metals.

pseudo-veratrine, *s.*

Chem.: $C_{14}H_{36}N_2O_3$ (?). Veratrin-resin. Helonine. A brown resinous substance obtained from the alcoholic extract of sabadilla seeds after the removal of sabadilline and veratrine. It melts at 185°, is soluble in alcohol, insoluble in ether and water, and does not neutralise acids.

pseudo-volcanic, *a.* Pertaining to, or produced by, a pseudo-volcano.

pseudo-volcano, *s.* A volcano which emits smoke and sometimes flame, but not lava; also, a burning mine of coal.

pseū-dō-brăn'-chĭ-æ, *s. pl.* [Pref. *pseudo-*, and Mod. Lat. *branchiæ* (q.v.).]

Compar. Anat.: The remains of an anterior gill performing respiratory functions during embryonic life. In the adult fish these organs lose those functions, and appear as *retia mirabilia*, receiving oxygenised blood, which, after having passed through the capillary system, is carried to the other parts of the head.

pseū-dō-brook'-īte, *s.* [Pref. *pseudo-*, and Eng. *brookite.*]

Min.: A mineral occurring in thin tabular crystals, associated with szaboite (q.v.), in andesite, at Aranyer Mount, Transylvania. Crystallization, orthorhombic. Hardness, 6·0; sp. gr. 4·98; lustre, adamantine to greasy; colour, dark-brown to black, thin crystals red; streak, ochre-yellow.
